

Improving Existing Teeth

Benefits of a new Procera crown:

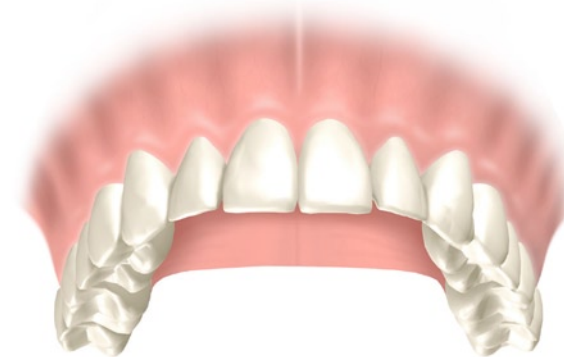

If the tooth is damaged or of poor quality, a new ceramic crown is probably the best solution. Installation is fast. The end result is fantastic.

The all-ceramic Procera crown has many advantages over traditional crowns. Besides its high esthetic qualities, the function and longevity of the crown is excellent as well.

- Superior esthetical result, compared to traditional crowns
- Easy installation, quick results
- Short and convenient treatment

Treatment

This procedure normally includes four visits to the dentist. You should expect to be able to work the day after having the implant installed.

Course of treatment

The course of treatment described here is one of several options available. Consult your dentist to find out what the best solution is for you, given your specific condition.

Placing a new crown – Step-by-step

1. Before procedure

The dentist makes a first evaluation and makes an impression of the existing crown. The impression is used as the prototype for the new crown.

2. Preparing the old tooth

The natural tooth is given minor preparation or adjustments. A temporary crown is attached.

3. Placing the new crown

A week or so after the first visit, the permanent crown is securely fitted. Normally, it will serve its owner for life..

4. End result

The end result is a new tooth that should blend in perfectly with the others. Brush and floss as recommended by your dentist or dental hygienist.
